136. NOTES ON THE OCCURRENCE OF *HYPNELLA PALLESCENS* (HOOK.) A. JAEGER (BRYOPHYTA, PILOTRICHACEAE) IN BAHIA, BRAZIL

Silvana B. VILAS BÔAS-BASTOS & Cid José P. BASTOS

Notas sobre la ocurrencia del Hypnella pallescens (Hook.) A. Jaeger (Bryophyta, Pilotrichaceae) en la Bahia, Brasil.

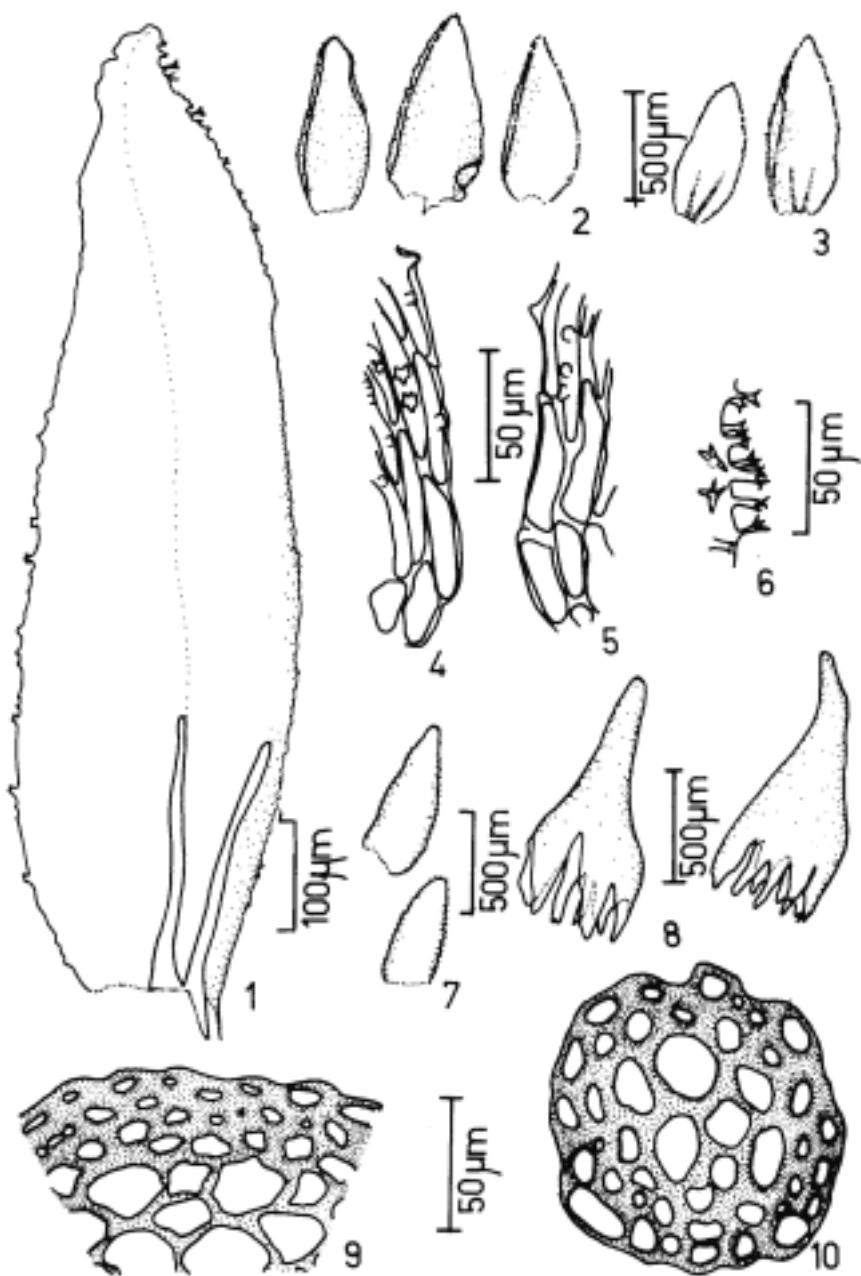

Key words. Pilotrichaceae, *Hypnella pallescens*, *Phylloodon truncatulus*, Atlantic Rain Forest, Brazil, Bahia.

Palabras-clave. Pilotrichaceae, *Hypnella pallescens*, *Phylloodon truncatulus*, Mata Atlântica, Brasil, Bahia.

The genus *Hypnella* (C. Muell.) A. Jaeger includes pleurocarpous mosses of neotropical distribution, and according to Buck (1998) is distinguished from other Hookeriales in the seriate papillae over the lumina of the cells. This genus was removed from Hookeriales and placed within the Hypnales, in the Sematophyllaceae, by Crosby (1974), based on supposed relationships to *Taxithelium* and *Glossadelphus*. However, Buck (1998) stated that some characteristics, such as strong double costa, lack of differentiated alar cells, 2-celled axillary hairs, and mitrate calyptrae, among other characters, prove to be

Hookeriales more than Hypnales. Thus, the genus *Hypnella* is positioned within Hookeriales, in the Pilotrichaceae (according to Buck 1998).

Hypnella pallescens (Hook.) A. Jaeger was reported for Brazil by Spruce (1867), Mitten (1869), Crosby *et al.* (1985), Lisboa & Yano (1987) and Churchill (1998). This species was erroneously recorded for the state of Bahia by Vilas Bôas-Bastos & Bastos (2000) as *Phylloodon truncatulus* (Müll. Hal.) Buck; both species are vegetatively similar, differing only in some characters, mainly to the sporophyte. Studying materials from new collections made in Bahia, this species was

Figures 1-10. *Hypnella pallescens* (Hook) Jaeg. 1: Leaf, showing the double costa; 2: stem leaves; 3: branch leaves; 4: basal margin of the stem leaf; 5: basal margin of the branch leaf; 6: papillae, lateral view; 7: perichaetial leaves; 8: calyptre; 9: cross section of the stem; 10: cross section of the branch.

found with sporophytes.

In this present paper, a description and illustrations of some morphological characters (see Buck 1998 and Vilas Bôas-Bastos & Bastos 2000 for the most complete illustrations) are provided.

The specimens were found at the "Estação Veracruz", a private biological reserve that represents a Tropical Atlantic Rainforest fragment, situated in southern Bahia, Brazil. All specimens are deposited at Alexandre Leal Costa Herbarium (ALCB), of the Instituto de Biologia of the Universidade Federal da Bahia, Brazil.

Hypnella pallescens (Hook.) A. Jaeger Ber.

Tätigk. St. Gallischen Naturwiss. Ges. 1875-76: 365. 1877. Figs. 1-10.

Basionym: 'Hookeria pallescens' Hook., Musci Exot. 1: 38. 1818.

Type-locality: Venezuela. Ad ripam fluminis Orinoco prope Esmeraldam, locis opacis Humboldt et Banpland. Holotype: E; Isotypes: BM, NY.

Gametophyte green, closely-foliate, prostrate, branches ascending. Stem in cross section, with 1-2 rows of small thick-walled cells surrounding 4-10 larger cells. Leaves erect-spreading, ovate to ovate-lanceolate, concave; costa short and double, absent in branch leaves; apex broadly obtuse to acute, margins plane, entire to slightly dentate below, strongly serrate above due to projecting large papillae; alar region scarcely or not differentiated, of 1-2 hyaline cells; cells brownish across insertion; median cells fusiform, seriatel papillae, papillae large, branched, stalked, stellate; basal cells elongate, rectangular, with 1-4 papillae or smooth. Perichaetal leaves small, ovate-lanceolate, strongly papillose. Sporophyte with setae elongate, capsule young, calyptrae mitrate, lobed at base.

Specimens examined: Brazil, Bahia:

between Eunápolis e Porto Seguro towns, "Veracruz" Forest Reserve, Juerana trail, 12/6/1999, S.B. Vilas Bôas-Bastos & C. Bastos 1094, 1099 (ALCB).

Geographic Distribution: Cuba, Jamaica, Puerto Rico, Guadeloupe, Dominica, Martinique, St. Lucia, Panama, Colombia, Venezuela, Trinidad, Guyana, Brazil, Ecuador, Peru (Crosby *et al.* 1985; Buck 1998).

The specimens were found on decaying logs in ombrophilous forest in southern Bahia. *Hypnella pallescens* has previously been reported for Brazil only from Amazonas (Spruce 1867, as *Hylotopsis*; Mitten 1869, as *Hookeria*; Crosby *et al.* 1985, Lisboa & Yano 1987, as *Hypnella cymbifolia*; Churchill 1998), Pará (Churchill 1998) and Rio de Janeiro (Crosby *et al.* 1985). In our previous paper (Vilas Bôas-Bastos & Bastos 2000) this species was erroneously recorded as *Phyllodon truncatulus* (Müll. Hal.) Buck; both *Phyllodon truncatulus* and *Hypnella pallescens* are vegetatively similar species, but the former does not have stalked-stellate papillae, and the calyptra is cucullate. Thus, the records of *Phyllodon truncatulus* must be excluded from the bryophyte flora from state of Bahia, Brazil.

ACKNOWLEDGMENTS. The authors are grateful to the Veracel Celulose S.A. for promoting access to the area and for support to the collectors.

137. NUEVOS DATOS SOBRE LA PTERIDOFLORA ALÓCTONA IBÉRICA

Juan J. HERRERO-BORGOÑÓN

New data about the non-native iberian pteridophyte flora.

Palabras clave. Pteridoflora, Corología, *Cyrtomium falcatum*, *Nephrolepis cordifolia*, Valencia, Comunidad Valenciana.

Key words. Pteridophyte flora, Chorology, *Cyrtomium falcatum*, *Nephrolepis cordifolia*, Valencia, Valencian Community.

Se aportan nuevos datos que amplían la distribución conocida en la Península Ibérica de dos especies de helechos de distribución tropical, de los que hasta el momento se conocen pocas citas en la misma. Ambos se cultivan con fines ornamentales y presentan una buena capacidad de propagación, habiéndose constatado su naturalización tanto en Europa como en otras partes del mundo.
